

Phase 1 Project

This project marks the end of Phase 1 part of the Moringa Data Science Program. In it, we have been given a data set to analyse with several expectations as below:

1. Overview

This overview has been borrowed from the Canvas assignment:

Our company is planning to diversify into the aviation business and plans to purchase and operate aircrafts for both commercial and private enterprises. Since the industry carries a lot of safety, financial and operational risks, the leadership wants to identify which aircraft models have the lowest risk investment while balancing safety, reliability and cost-effectiveness.

2. Business Understanding

Our company aims to:

Objectives:

To determine:

1. Different aircraft make and models and categorize based on aircraft category and purpose of flight.

Within each category, to determine the relation between Airplane Make and:

1. Operational cost effectiveness (Engine type).
2. Safety risk (injury severity, total fatal injuries, total serious injuries).
3. Mechanical reliability and environmental susceptibility of the aircraft (aircraft damage).

To determine success, this will be measured by delivering clear data presenting recommendations to guide procurement of the most suitable Aircraft Makes.

3. Data Understanding

Data Source

The data we will be using was sourced from the National Transportation Safety Board.

Data Description

The data includes aviation accident data from 1962 to 2023 about civil aviation accidents and selected incidents in the United States and international waters and it captures the following:

Event.Id

Investigation.Type

Accident.Number
Event.Date
Location
Country
Latitude
Longitude
Airport.Code
Airport.Name
Injury.Severity
Aircraft.damage
Aircraft.Category
Registration.Number
Make
Model
Amateur.Built
Number.ofEngines
Engine.Type
FAR.Description
Schedule
Purpose.of.flight
Air.carrier
Total.Fatal.Injuries
Total.Serious.Injuries
Total.Minor.Injuries
Total.Uninjured
Weather.Condition
Broad.phase.of.flight
Report.Status
Publication.Date

This marks the end of the Data Preparation and Cleaning.

4. Data analysis

We will need several libraries for the following purposes:

1. Pandas - to read, edit and save our python files.
2. Numpy - for statistical computations for measures of central tendency and dispersion.
3. Matplotlib and seaborn - for visualizations.

4.1 Data Preparation

We shall first start off with data cleaning

In [1]: *# importing necessary Libraries*

```
import pandas as pd
import numpy as np
import matplotlib.pyplot as plt
%matplotlib inline
import seaborn as sns
```

In [2]: *# read into our aviation csv data using pandas and save it as variable name - aviati*

```
aviation_data = pd.read_csv('Aviation_Data.csv')
```

c:\Users\PC\anaconda3\envs\learn-env\lib\site-packages\IPython\core\interactiveshell.py:3145: DtypeWarning: Columns (6,7,28) have mixed types.Specify dtype option on import or set low_memory=False.
has_raised = await self.run_ast_nodes(code_ast.body, cell_name,

In [3]: *# read into our first 5 rows to understand how the data is organized*

```
aviation_data.head()
```

Lets look at the columns we have to define further our data requirements

```
aviation_data.columns
```

Out[3]: Index(['Event.Id', 'Investigation.Type', 'Accident.Number', 'Event.Date', 'Location', 'Country', 'Latitude', 'Longitude', 'Airport.Code', 'Airport.Name', 'Injury.Severity', 'Aircraft.damage', 'Aircraft.Category', 'Registration.Number', 'Make', 'Model', 'Amateur.Built', 'Number.of.Engines', 'Engine.Type', 'FAR.Description', 'Schedule', 'Purpose.of.flight', 'Air.carrier', 'Total.Fatal.Injuries', 'Total.Serious.Injuries', 'Total.Minor.Injuries', 'Total.Uninjured', 'Weather.Condition', 'Broad.phase.of.flight', 'Report.Status', 'Publication.Date'], dtype='object')

```

The dataset had a total of 90,348 rows (entries) and 31 columns. Out of the many columns in the previous cell, we need to define the ones we will be using for our analysis. The project expects us to determine the best aircraft based on accidents profile. Therefore the following columns may be necessary. Out of the 31 columns, we have selected the 12 below to answer our objectives that were listed above:

1. Event Date
2. Total Fatal Injuries
3. Total Serious Injuries
4. Total minor injuries
5. Injury Severity
6. Aircraft Damage
7. Make - type of aircraft 8 Model - type of the model of the make
8. Engine type
9. Aircraft Category
10. Purpose of flight
11. Air carrier

```

In [5]: # Let us create a variable name 'selected_columns' which has the columns we purposef
selected_columns = ['Event.Date', 'Injury.Severity', 'Aircraft.damage', 'Aircraft.Ca
'Purpose.of.flight', 'Air.carrier', 'Total.Fatal.Injuries',
'Total.Serious.Injuries', 'Total.Minor.Injuries']

```

```

In [6]: # Let us re-create our aviation_data dataset with only the selected columns:
aviation_data = aviation_data[selected_columns]

```

```

In [7]: # Let us check out the column names to confirm that we only have the selected column
aviation_data.columns, len(aviation_data.columns)

```

```

Out[7]: (Index(['Event.Date', 'Injury.Severity', 'Aircraft.damage', 'Aircraft.Category',
'Make', 'Model', 'Engine.Type', 'Purpose.of.flight', 'Air.carrier',
'Total.Fatal.Injuries', 'Total.Serious.Injuries',
'Total.Minor.Injuries'],

```

```
dtype='object'),
12)
```

Handling missing data

```
In [8]: # Let us go through each of the selected columns again and determine their data type
aviation_data.info()
```

```
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 90348 entries, 0 to 90347
Data columns (total 12 columns):
 #   Column                Non-Null Count  Dtype
---  -
 0   Event.Date            88889 non-null  object
 1   Injury.Severity       87889 non-null  object
 2   Aircraft.damage       85695 non-null  object
 3   Aircraft.Category     32287 non-null  object
 4   Make                  88826 non-null  object
 5   Model                 88797 non-null  object
 6   Engine.Type           81812 non-null  object
 7   Purpose.of.flight     82697 non-null  object
 8   Air.carrier           16648 non-null  object
 9   Total.Fatal.Injuries  77488 non-null  float64
10   Total.Serious.Injuries 76379 non-null  float64
11   Total.Minor.Injuries  76956 non-null  float64
dtypes: float64(3), object(9)
memory usage: 8.3+ MB
```

```
In [9]: # Before we can do an analysis on our data, we first need to fill in the missing val
# We have 5 columns that are float data type (numeric) and 11 that are object (non-n
# Let us create a for loop to determine how many missing values first in the float64
for column in aviation_data.columns:
    if aviation_data[column].dtype == 'float64':
        print (column, aviation_data[column].isna().sum())

4.2 Data Analysis

Now we can start the data analysis. In this section we aim to reiterate the objectives and do a:

1. Summary in measures of central tendency of both numerical (means and medians) as well as categorical variables (in value counts).
2. Do several plots (in line with the objectives) showing relation between:

** Different aircraft make and purpose of flight

** Different aircraft make and operational cost effectiveness: Engine type

** Different aircraft make and Safety risk of the aircraft (injury severity, total fatal injuries, total serious injuries)

** Different aircraft make and Mechanical reliability and environmental susceptibility of the aircraft (aircraft.damage)

Objective 1: Summary in measures of central tendency of both numerical (means and medians) as well as categorical variables (in value counts).

```
In [27]: # Summary data on the numerical data using a for loop

```

From this numerical summary, we had 3485 accidents.

1. Most aircrafts had 1 engine.
2. The mean number of total Fatal injuries was 1.7 (+/- 13.6).
3. The mean number of total Serious injuries was 0.68 (+/- 5.32).
4. The mean number of total Minor injuries was 0.57 (+/- 7.57).
5. The mean number of total Uninjured was 35.5 (+/- 74.7).

Aircraft with less crashes: Sabrena
Aircraft with less crashes: Cornett Steven M
Aircraft with less crashes: Omlin Robert G
Aircraft with less crashes: Lennox Kenneth J
Aircraft with less crashes: Kerr John A
Aircraft with less crashes: Boeing-Stearman

Aircraft with less crashes: Mallory Christopher L
 Aircraft with less crashes: Flournoy Martin R
 Aircraft with less crashes: Wsk-Pzl Warszawa-Okecie
 Aircraft with less crashes: Allstar Pzl Glider
 Aircraft with less crashes: Zenith Aircraft Co
 Aircraft with less crashes: Wsk-Mielec
 Aircraft with less crashes: I.C.A.-Brasov (Romania)
 Aircraft with less crashes: Co-Z Development Corp
 Aircraft with less crashes: Ultralight America
 Aircraft with less crashes: Atkinson
 Aircraft with less crashes: Brown Narcisse A
 Aircraft with less crashes: Yamokoski William
 Aircraft with less crashes: Charles Peet
 Aircraft with less crashes: Monte Clark
 Aircraft with less crashes: Helpling Helen C
 Aircraft with less crashes: Nolan
 Aircraft with less crashes: Moser Georg
 Aircraft with less crashes: Flightstar Inc
 Aircraft with less crashes: Jewett

In [30]: *# Confirming that we have made a list of safe planes - with the least crashes*

From the summary data on the categorical variables:

1. Most crashes were non-fatal (2700) while the 2nd most crashes were fatal (500).
2. Most injury severity to the aircraft was substantial (2449), destroyed (517) or minor (514).
3. Most aircrafts were airplanes (2987), followed by helicopter (475) and balloon (11).
4. Most aircraft make involved in accidents were: Boeing (834), Cessna (538), Piper (249) then Airbus (207). Many other aircrafts as shown in the output above had less than 2 crashes. This means that they had the least number of crashes that could be interpreted as a safe aircraft.
5. The most common aircraft model was the 737 (218), A£320 (61), 208B (58), 747 (51), 777 (46)
6. The most common engine type was reciprocating (1961), tubro fan (686), turbo prop (318), turbo shaft (298).
7. The purpose for majority of the flights was unknown (2864) but of the known, they were for personal (211), aerial application (193) and business (61)
8. American airlines operated the largest fleet (1008), followed by South West Airlines (41), Delta Airlines (37) and United Airlines (37)

Objective 2.1: Relation between different aircraft make and purpose of flight

```
In [31]: # we will first save the common purposes as variable name 'common purposes' to inclu
# Define the selected purposes
# Define the selected purposes
selected_purposes = [
    'Personal',
    'Business',
```

```

    'Other Work Use',
    'Executive/corporate',
    'Public Aircraft - Local',
    'Public Aircraft - State'
]

# Filter dataset for only these purposes
filtered_data = aviation_data[aviation_data['Purpose.of.flight'].isin(selected_purpo

# Group by purpose and show all unique aircraft makes per purpose
aircraft_examples_by_purpose = (

Concerning the engines:

Reciprocating engines are simple and very easy to maintain. They are efficient at low speeds and altitudes. They are mostly used for light aircraft and short-range flights. #

Turboprop engines are efficient at medium speeds and are beneficial in regional flights, short to medium haul flights

Turboprop engines are also good for high speeds but have lesser fuel efficiency than turboprop. They however have less mechanical complexity. They are used for long range flights

Objective 2.3: Relation between aircraft make and Safety risk of the aircraft (injury severity, total fatal injuries, total serious injuries).

In this section, we make several assumptions:

1. The aircraft with the least injury severity is the safest.
2. The aircraft with the least total fatal injuries is safest.
3. The aircraft with the least total serious injuries is safest.

2.3.1 Injury_severity

```
In [35]: # For the injury severity, let us look at the frequency of injury severity based on
# Group by Injury.Severity and show all aircraft makes for each severity
injury_examples = (
    aviation_data.groupby('Injury.Severity')['Make']

```

```
plt.tight_layout()
plt.show()
```

This marks the end of our analysis based on the objectives we had formulated in the beginning.

5. Recommendations

To finally recommend which aircraft would be the best to purchase, we will divide the crafts into:

a. For the safe planes (those which had the least number of crashes which we deemed as safest), we want to know those that are useful for:

Personal

Business

Other Work Use

Executive/corporate

Public Aircraft - Local

Public Aircraft - State

In each, we want to categorize:

1. Which is good for short, medium or long range flights based on engine type.
2. From this list, we want those with less injuries + less total fatal injuries + less total serious injuries (meaning less people succumbed) and:
3. From the above list, we want those with minor aircraft damage (meaning they are mechanically and structurally sound)

```
In [41]: # To do the above, we will first define a function

def get_safe_planes(data, makes, purpose, engine_type,
                    injury_severity='Non-Fatal', max_fatal=5, max_serious=5,
```

```

        damage='Minor'):
    """
    Returns aircraft makes that meet safety criteria for a given make, purpose, and

    Parameters:
        data (DataFrame): Aviation dataset.
        makes (list or str): Aircraft makes to include.
        purpose (str): Purpose of flight to filter.
        engine_type (str): Engine type to filter.
        injury_severity (str): Injury severity to filter (default 'Non-Fatal').
        max_fatal (int): Maximum allowed total fatal injuries (default 5).
        max_serious (int): Maximum allowed total serious injuries (default 5).
        damage (str): Aircraft damage category (default 'Minor').

    Returns:
        list: List of aircraft makes that meet the criteria.
    """
    if isinstance(makes, str):
        makes = [makes] # convert single make to list

    filtered = data[
        (data['Make'].isin(makes)) &
        (data['Purpose.of.flight'] == purpose) &
        (data['Engine.Type'] == engine_type) &
        (data['Injury.Severity'] == injury_severity) &
        (data['Total.Fatal.Injuries'] < max_fatal) &
        (data['Total.Serious.Injuries'] < max_serious) &
        (data['Aircraft.damage'] == damage)
    ]

    return filtered['Make'].tolist()

```

In [42]: *# Let us attempt all sorts of combinations to get the best version of planes suited ;
We shall use a nested for loop for this:*

```

```

From our dataset, it appears that the safest plane (one with the least number of accidents) were purposefully used for personal flights. These had the least number of fatal injuries, serious injuries while having a non-fatal injury severity and minor aircraft accidents.

In addition to the above, if the company wishes to procure a plane for long range flights, the 'GulfStream American Corp'. is the best.

For medium range flights, the 'Evo13 Llc', 'Short Brothers' & 'Harland Ltd' are the best options.

For short range flights, the 'T Bird', 'Rolladen-Schneider Ohg', 'Univar', 'Krusmark David Homer', 'Starduster Ii', 'Mueller Michael Walter', 'Schleicher Alexander', 'Boeing 777-306Er', 'Consolidated Vultee', 'Dji', 'Honda' are the best options.

6. Conclusions

In this notebook, we were able to suggest the most operational, safe and mechanically reliable plane for procurement for our company using data from the NTSB report of accidents from 1962 - 2023.

Suggestions for further study: Despite having analyzed this dataset to suggest which aircrafts Makes had the least air crashes while still being most operational, safe and mechanically sound, the best suggestions would have come from a dataset of commonly used aircrafts for better predictions.

```
In [43]: #To finalize the creation of the Tableau images, we need to use the Cleaned excel sh  
aviation_data.to_excel('aviation_data_cleaned.xlsx')
```

We finalized our analysis by creating a dashboard in Tableau summarizing the Airplane Makes that are:

1. Most operational based on engine type.
2. Safest based on having the least total fatal injuries.
3. Mechanically stable based on having a non-fatal injury severity.
